In the quiet Village of Pulaski, Wisconsin, the local Cub Scout 4031 was having their annual August event with some help from the older scouts of BSA troops 1468 and 6468. Everything seemed to be in order, there was fun and games, skits and songs. Around 10:30 pm on August 26th, eye witnesses claim to have seen four signal flare set off into the sky. One could only guess at their meaning as they flew up into the sky drifting to the North East until they were out of sight. The night seemed to take a turn for the strange after that.

There are as many different stories as people who were asked. Some claim there were gusty winds throughout the night while other report it as calm. There are reports of some low rumbling in one area, while quiet in others. There were several reports of a red light and a scratching sound around 3:00 am on August 27th, but no one was prepared for what they would

Foot print of assorted color seem to be walking through the camp, between tents and then up around the large shelter could be seen. A couple of trash cans were overturned and riffled through by what seems to be a large animal walking on 2 feet. One bystander reported that he thought it may be due to some new stroid they had been giving to local chickens, but sever others felt strongly that it was something else.

DINOSAURS! Are what many claimed. With three large talon shaped toes and roughly the size of an older scouts foot, there was some speculation by some fortune hunters brandishing freshly forged duct-tape-cardboard weapons that it was a veloceraptor that had crept from under some nearby trees and rounded the building possibly looking for a late night snack or early morning breakfast. There are

see when they climbed from their tents the next day.

no Cub Scouts missing at this time.

Authorities are dismissing the dinosaur track sighting as a hoax put on some by local pranksters, but this is where Pack 4031 NEWS stays on top of things and will keep digging until we get to the bottom of this mystery. Afterall, feet don't just walk out of trees on their own, there is usually something attached; like legs. And what do those legs belong to? Are we in danger? Why are local scientists so quiet on the matter? Stick with us and we will find out.
